# A Conjecture Concerning Prime Numbers 

Cătălin Angelo Ioan ${ }^{1}$, Alin Cristian Ioan ${ }^{2}$

#### Abstract

The paper examines the conditions under which a second degree polynomial generates primes variable values between 0 and the constant term - 1. It is shown that for values of the constant term equal to or less than 41 , such polynomials exist and we are proposing a conjecture that for the polynomials with the constant term greather than 41 the statement is not true.

Keywords: prime; polynomials

## 1. Introduction

The prime number theory dates back to ancient times (see the Rhind papyrus or Euclid's Elements).

A number $\mathrm{p} \in \mathbf{N}, \mathrm{p} \geq 2$ is called prime if its only positive divisors are 1 and p . The remarkable property of primes is that any nonzero natural number other than 1 can be written as a unique product (up to a permutation of factors) of prime numbers to various powers.
If there is not a formula, for the moment, generating prime numbers, there exist a lot of attempts (all unsuccessful) to determine it.

Unfortunately, many results about primes are at the stage of conjectures (theorems that seem to be valid, but remained unproven yet).

## 2. Main Results

Let $\mathrm{P}(\mathrm{n})=\mathrm{an}^{2}+\mathrm{bn}+\mathrm{c}, \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathbf{Z}, \mathrm{c} \geq 2,(\mathrm{a}, \mathrm{b}, \mathrm{c})=1$.
We propose the determination of $\mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathbf{Z}$ such that $\mathrm{P}(\mathrm{n})=$ prime $\forall \mathrm{n}=\overline{0, \mathrm{c}-1}$.

[^0]Using the Wolfram Mathematica software, in order to determine the polynomials (for $\mathrm{c} \leq 41$ ):

Clear["Global"*"];
polynomial[a_,b_,c_,n_]=a*n^2+b*n+c;
lowerlimitc=2;
upperlimitc=41;
upperlimit=200;
For [c=lowerlimitc, $\mathbf{c}<=$ upperlimitc, $c++$,
maximuma=0;
maximumb=0;
maximumc $=0$;
maximumcounter=1;
increase $=2$ upperlimit;
If[PrimeQ[c],
For $[\mathbf{a}=-$ upperlimit, $\mathrm{a}<=$ upperlimit,a++,
For[b=-upperlimit,b<=upperlimit,b++, counter=0; exit=0; If $[\mathbf{a} \neq \mathbf{0}$, $\operatorname{For}[\mathbf{n}=\mathbf{0}, \mathbf{n}<\mathbf{c}, \mathbf{n}++$, If[PrimeQ[polynomial[a,b,c,n]]\&\&exit=0,counter=cou nter+1,exit=1]]];

If[exit=0\&\&counter $\geq$
maximumcounter,If[(Abs[a]+Abs[b])<
increase,maximumcounter=counter;maximuma=a;maximumb $=\mathrm{b}$;
maximumc=c;increase=Abs[a]+Abs[b]]]I]];
If[maximumcounter $\geq 2$, Print["a=",maximuma," b=",maximumb," c=",maximumc];
For $[\mathbf{n}=\mathbf{0}, \mathrm{n}<\mathrm{c}, \mathrm{n}++, \operatorname{Print}[$ polynomial[maximuma,maximumb,maximumc, x$]]]$,If $[$
PrimeQ[c],Print["c=",c," accepts no polynomial"]]I]]
we get:

| $\mathbf{c}$ | $\mathbf{P}(\mathbf{n})=\mathbf{a n}^{2}+\mathbf{b n}+\mathbf{c}$ | Module of Primes |
| :---: | :---: | :---: |
| 2 | $\mathrm{P}(\mathrm{n})=\mathrm{n}^{2}+2$ | 2,3 |
| 3 | $\mathrm{P}(\mathrm{n})=\mathrm{n}^{2}-\mathrm{n}+3$ | $3,3,5$ |

| 5 | $\mathrm{P}(\mathrm{n})=\mathrm{n}^{2}-\mathrm{n}+5$ | 5, 5, 7, 11, 17 |
| :---: | :---: | :---: |
| 7 | $P(n)=2 n^{2}-2 n+7$ | 7, 7, 11, 19, 31, 47, 67 |

| 13 | $\mathrm{P}(\mathrm{n})=6 \mathrm{n}^{2}+13$ | 13, 19, 37, 67, 109, 163, 229, 307, 397, 499, 613, 739, 877 |
| 17 | $\mathrm{P}(\mathrm{n})=\mathrm{n}^{2}-\mathrm{n}+17$ | $\begin{gathered} 17,17,19,23,29,37,47,59,73,89,107,127,149,173, \\ 199,227,257 \end{gathered}$ |
| 19 | $\mathrm{P}(\mathrm{n})=2 \mathrm{n}^{2}-2 \mathrm{n}+19$ | $19,19,23,31,43,59,79,103,131,163,199,239,283,331$, $383,439,499,563,631$ |
| 23 | $\mathrm{P}(\mathrm{n})=3 \mathrm{n}^{2}-3 \mathrm{n}+23$ | $\begin{gathered} 23,23,29,41,59,83,113,149,191,239,293,353,419 \\ 491,569,653,743,839,941,1049,1163,1283,1409 \end{gathered}$ |
| 29 | $\mathrm{P}(\mathrm{n})=2 \mathrm{n}^{2}+29$ | $29,31,37,47,61,79,101,127,157,191,229,271,317$, $367,421,479,541,607,677,751,829,911,997,1087$, $367,421,479,541,607,677,751,829,911,997,1087$, $1181,1279,1381,1487,1597$ |
| 31 | $\mathrm{P}(\mathrm{n})=-3 \mathrm{n}^{2}+45 \mathrm{n}+31$ | $31,73,109,139,163,181,193,199,199,193,181,163$, $139,109,73,31,17,71,131,197,269,347,431,521,617$, $719,827,941,1061,1187,1319$ |
| 37 | $P(n)=-4 n^{2}+76 n+37$ | $37,109,173,229,277,317,349,373,389,397,397,389$, $373,349,317,277,229,173,109,37,43,131,227,331$, $443,563,691,827,971,1123,1283,1451,1627,1811$, $2003,2203,2411$ |
| 41 | $\mathrm{P}(\mathrm{n})=\mathrm{n}^{2}-\mathrm{n}+41$ | $41,41,43,47,53,61,71,83,97,113,131,151,173,197$, $223,251,281,313,347,383,421,461,503,547,593,641$, $691,743,797,853,911,971,1033,1097,1163,1231,1301$, $1373,1447,1523,1601$ |

For $\mathrm{c} \geq 43$ we have that from the condition that $\mathrm{P}(\mathrm{n})=\mathrm{an}^{2}+\mathrm{bn}+\mathrm{c}=$ prime $\forall \mathrm{n}=$ $\overline{0, c-1}$ implies that $a+b=e v e n$. Indeed, if the prime is different from 2 , we have that: $\mathrm{an}^{2}+\mathrm{bn}=$ even for any $\mathrm{n}=\overline{0, \mathrm{c}-1}$ except possibly two values for which $\mathrm{P}(\mathrm{n})$ $=2$.

But for two consecutive numbers $n, n+1$ such that $P(n)=a^{2}+b n+c=$ prime $_{1} \neq 2$, $\mathrm{P}(\mathrm{n}+1)=\mathrm{a}(\mathrm{n}+1)^{2}+\mathrm{b}(\mathrm{n}+1)+\mathrm{c}=$ prime $_{2} \neq 2$ we have that: $\mathrm{an}^{2}+\mathrm{bn}=$ even, $a(n+1)^{2}+b(n+1)=$ even therefore the difference: $2 a n+a+b=$ even that is $a+b=$ even.

The structure of the polynomial becomes then:

$$
\mathrm{P}(\mathrm{n})=\mathrm{an}^{2}+(2 \mathrm{~d}-\mathrm{a}) \mathrm{n}+\mathrm{c}, \mathrm{a}, \mathrm{~b}, \mathrm{~d} \in \mathbf{Z}
$$

Investigating for values of c greater than 41 to 1000 , we have not found polynomials with this property, considering reasonable limits for $a$ and $b$ less than 200.

Finally we state the following:

## Conjecture

There is not a polynomial $P(n)=\mathrm{an}^{2}+\mathrm{bn}+\mathrm{c}, \mathrm{a}, \mathrm{b}, \mathrm{c} \in \mathbf{Z}, \mathrm{c} \geq 43,(\mathrm{a}, \mathrm{b}, \mathrm{c})=1$ such that $\mathrm{P}(\mathrm{n})=$ prime $\forall \mathrm{n}=\overline{0, \mathrm{c}-1}$.
